

PKB.rocks Android App Signing Attestation

Plektra and Pastiera – Stable

Patrick Zauner

2026-09-25

Attestation

I attest that Certificates A, B, and C are the PKB.rocks stable Android app signing certificates for these application IDs:

- rocks.pkb.plektra
- it.palsoftware.pastiera

The authorized signing succession is $A \rightarrow B \rightarrow C$. A is the initial signer; releases may switch directly from A to C, skipping B. Once B is adopted for releases, A must no longer sign new releases; once C is adopted, only C may sign new releases. Earlier signatures remain valid. Introducing a new signing key after C requires an authorized extension of the signing lineage.

Certificate identity

Subject and issuer	CN=Patrick Zauner, O=PKB.rocks, OU=Plektra (successor to Pastiera) - Stable Android App Signing
Public key	ECC P-256
Signature	ECDSA with SHA-256
Validity start	2026-09-05 00:00:00 UTC
Validity end	2126-09-05 00:00:00 UTC

Certificate fingerprints

Each fingerprint is the SHA-256 digest of the DER-encoded X.509 certificate.

Certificate	Role	SHA-256
A	Initial	b28ac03130088bb27a356e1dd704b35f2701268474a386c348d07ed92f3ef71a
B	Next	0af4f6b9f964886eef11400926a388904388b1f6608d88eeba90d539f74d9099
C	Last	c9207e47369e421ae69d0e64ba1ba3e67e9a739d94e444a4ba83c1085cc09a56

Hardware attestation

PIV slot	9C (Digital Signature)
Key origin	GENERATED
PIN policy	ALWAYS
Touch policy	ALWAYS

The Yubico PIV attestation for each signer verifies on-device key generation. Each attested public key matches its Android signing certificate. Each attestation chain verifies to Yubico Attestation Root 1 through the included intermediate certificates. Complete hardware attestations and manufacturer certificates follow on separate pages.

Signer	Slot-attestation certificate (DER, SHA-256)
A	3ab6a3c29e398fca1720f42682f9e6abcaf61fcfac41cc59c67eef99f62b7030
B	d30b9cf41ae6730c6e5bbeda77ac3cb07bb0d4f65467e64f25496b0a9fb6ecfe
C	67ee9339415cccbff65354927615ac20f02c7e3d21cb3a33f08e28d3c6ae87bd

F9 attestation certificate (DER, SHA-256; A, B and C)
7ee706d267df53e5cc4505372d26e5daeadd8feaaaf4b58562afde8cc392192c1

Yubico Attestation Root 1 (DER, SHA-256)
62760c6a6ef91679f454c8902b80fd009825b3f25da90f1fbace2ec6586cd5a8

Android signing continuity

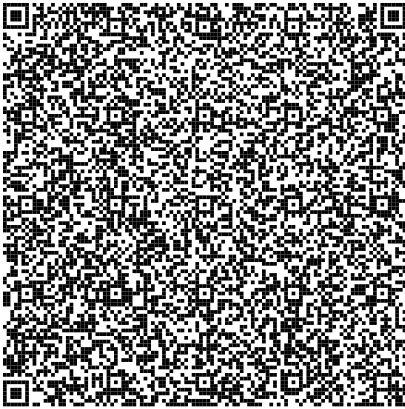

rocks.pkb.plektra
Stable A -> Stable B -> Stable C
signing/lineages/plektra-stable-v1.lineage
SHA-256 12e9535b2897d10a61e5715555876397628d4d4f2acb51ec73005c7d7db22b5b

it.palsoftware.pastiera
Legacy Stable -> Stable A -> Stable B -> Stable C
signing/lineages/pastiera-stable-v1.lineage

APK verification

Use Android SDK `apksigner` to identify the current APK signer:

```
APK="${1:?usage: verify-stable-apk APK}"
ACTUAL="$(
  apksigner verify --print-certs "$APK" |
  awk -F': ' '/certificate SHA-256 digest/ { print tolower($2); exit }'
)"
case "$ACTUAL" in
  b28ac03130088bb27a356e1dd704b35f2701268474a386c348d07ed92f3ef71a) echo 'OK: PKB.rocks Stable Certificate A' ;;
  0af4f6b9f964886eef11400926a388904388b1f6608d88eeba90d539f74d9099) echo 'OK: PKB.rocks Stable Certificate B' ;;
  c9207e47369e421ae69d0e64ba1ba3e67e9a739d94e444a4ba83c1085cc09a56) echo 'OK: PKB.rocks Stable Certificate C' ;;
  *) echo 'NOT OK: unrecognized signer.' >&2
    echo 'Check for updated signing attestations if this APK continues an authorized lineage.' >&2
    printf 'Actual: %s\n' "$ACTUAL" >&2; exit 1 ;;
esac
```

Hardware evidence verification

The accompanying script `scripts/verify-signing-key-attestations.py` verifies the printed certificates and their QR payloads from this Markdown source. It traces each slot attestation through its F9 certificate and the two manufacturer intermediates to Yubico Attestation Root 1. It also verifies the Android certificate self-signatures and the matching public keys.

```
python3 scripts/verify-signing-key-attestations.py
```

Python 3 and OpenSSL 3 are required. If necessary, select OpenSSL explicitly with `--openssl /path/to/openssl`. No YubiKey, PIN, private evidence directory or additional Python package is required.

The root is independently fetched over HTTPS from:

<https://developers.yubico.com/PKI/yubico-ca-1.pem>

The downloaded root must match this pinned DER SHA-256 fingerprint:

```
62760c6a6ef91679f454c8902b80fd009825b3f25da90f1fbace2ec6586cd5a8
```

The root is cached under `~/.cache/pkb-signing-attestations`. Repeated runs reuse that file only after checking its fingerprint. An unexpected cached or downloaded root causes verification to fail. Embedded intermediates are treated as untrusted until their complete certificate chain verifies.

This script does not validate the document QES signatures or Android installation behaviour.
